

Package ‘fanovaGraph’

October 13, 2022

Type Package

Title Building Kriging Models from FANOVA Graphs

Version 1.5

Date 2020-10-01

Author Jana Fruth, Thomas Muehlenstaedt, Olivier Roustant, Malte Jastrow, Sonja Kuhnt

Maintainer Sonja Kuhnt <sonja.kuhnt@fh-dortmund.de>

Description

Estimation and plotting of a function's FANOVA graph to identify the interaction structure and fitting, prediction and simulation of a Kriging model modified by the identified structure. The interactive function plotManipulate() can only be run on the 'RStudio IDE' with 'RStudio' package 'manipulate' loaded. 'RStudio' is freely available (<<https://rstudio.com/>>), and includes package 'manipulate'. The equivalent function plotTk() bases on CRAN Repository packages only. For further information on the method see Fruth, J., Rous-
tant, O., Kuhnt, S. (2014) <[doi:10.1016/j.jspi.2013.11.007](https://doi.org/10.1016/j.jspi.2013.11.007)>.

fanovaGraph-package *Building Kriging models with FANOVA graphs*

Description

Estimates and plots the FANOVA graph of a function to identify its interaction structure and fits a kriging model modified by the identified structure

Details

Important functions:

| | |
|------------------------------|---|
| <code>estimateGraph</code> | Estimate indices for the graph, create graph structure |
| <code>threshold</code> | Set indices below a threshold to zero |
| <code>plot.graphlist</code> | Plot a given graph structure |
| <code>plotDeltaJumps</code> | Provide plots for the choice of the threshold |
| <code>kmAdditive</code> | Kriging model estimation with block-additive kernel |
| <code>predictAdditive</code> | Prediction function from Kriging model with block-additive kernel |
| <code>simAdditive</code> | Simulation from Kriging model with block-additive kernel |

estimateGraph

FANOVA graph estimation.

Description

Estimates the structure of the FANOVA graph by estimating the total interaction indices for the graph edges (a particular case of superset importance introduced by Liu and Owen, 2006), the main effect indices for the graph vertices and the overall variance for normalizing the indices and finding the clique structure of the estimated graph.

Usage

```
estimateGraph(f.mat, d, q = NULL, q.arg = NULL, n.tot = NULL, method = "LiuOwen",
n.lo = NULL, n.mc = NULL, n.fast = 500, L = NULL, M = 6, n.pf = NULL, n.main = 1000,
confint = TRUE, print.loop.index = FALSE, ...)
```

Arguments

| | |
|--------|--|
| f.mat | vectorized function for which the FANOVA graph shall be estimated |
| d | integer, number of input factors (vertices) |
| q | a vector of character strings of quantile functions corresponding to the factors distributions, it can be a single character string meaning same distribution for all, if not specified "quNFL" is taken |
| q.arg | a list of lists of quantile functions parameters of the distributions in q, it can be a single list meaning same parameters for all, if not specified the default values of the respective distributions are taken |
| n.tot | optional integer, total number of function evaluations, instead of n.tot method related parameters (n.lo, n.mc, L or n.sobol) can be provided |
| method | character string specifying the estimation method of the total interaction indices, to be chosen between "LiuOwen", "FixFast", "RBD" and "PickFreeze", defaults to "LiuOwen", see references for further details |

| | |
|-------------------------------|--|
| <code>n.lo</code> | optional integer, only if <code>method="LiuOwen"</code> , number of Monte Carlo simulations in method of Liu and Owen |
| <code>n.mc</code> | optional integer, only if <code>method="FixFast"</code> , number of Monte Carlo simulations for the expectation in fixing method using FAST |
| <code>n.fast</code> | optional integer, only if <code>method="FixFast"</code> , number of design points for FAST algorithm, defaults to 500 |
| <code>L</code> | optional integer, only if <code>method="RBD"</code> , parameter L in RBD-FAST method |
| <code>M</code> | optional integer, only if <code>method="RBD"</code> , parameter M in RBD-FAST method |
| <code>n(pf</code> | optional integer, only if <code>method="PickFreeze"</code> , number of Monte Carlo simulations in pick-and-freeze method |
| <code>n.main</code> | integer, number of Monte Carlo Simulations for computing main effect indices |
| <code>confint</code> | optional Boolean, if TRUE, standard error and 95% confidence intervals of the indices are computed additionally for <code>method="LiuOwen"</code> , defaults to TRUE |
| <code>print.loop.index</code> | optional Boolean, if TRUE, loop indices are printed |
| <code>...</code> | additional arguments to be passed to the function <code>f.mat</code> |

Value

an object of class `graphlist` containing the graph structure which includes

| | |
|-------------------------|--|
| <code>d</code> | number of input factors |
| <code>tii</code> | matrix containing the unscaled total interaction indices and if <code>confint = TRUE</code> their standard error and lower and upper confidence limits |
| <code>i1</code> | matrix containing the unscaled main effect indices |
| <code>V</code> | overall variance |
| <code>tii.scaled</code> | matrix containing the scaled total interaction indices |
| <code>cliques</code> | list of cliques |

Examples

```
# Ishigami function, true analytical values: D12 = D23 = 0, D13 =~ 3.374
q.arg = list(list(min=-pi, max=pi), list(min=-pi, max=pi), list(min=-pi, max=pi))
estimateGraph(f.mat=ishigami.fun, d=3, q.arg=q.arg, n.tot=10000, method="LiuOwen")
estimateGraph(f.mat=ishigami.fun, d=3, q.arg=q.arg, n.tot=10000, method="FixFast")
estimateGraph(f.mat=ishigami.fun, d=3, q.arg=q.arg, n.tot=10000, method="RBD")
estimateGraph(f.mat=ishigami.fun, d=3, q.arg=q.arg, n.tot=10000, method="PickFreeze")
```

Description

Estimation of the unscaled pure second order Sobol indices.

Usage

```
i2Index(f.mat, d, q = NULL, q.arg = NULL, n.i2, ...)
```

Arguments

| | |
|--------------------|--|
| <code>f.mat</code> | vectorized function of which indices shall be estimated |
| <code>d</code> | integer, number of input factors (vertices) |
| <code>q</code> | a vector of character strings of quantile functions corresponding to the factors distributions, it can be a single character string meaning same distribution for all, if not specified "qunif" is taken |
| <code>q.arg</code> | a list of lists of quantile functions parameters of the distributions in <code>q</code> , it can be a single list meaning same parameters for all, if not specified the default values of the respective distributions are taken |
| <code>n.i2</code> | number of Monte Carlo evaluations |
| <code>...</code> | additional arguments to be passed to the function <code>f.mat</code> |

Value

A vector containing the unscaled pure second order indices

Author(s)

J. Fruth

kmAdditive

Constrained MLE Optimization

Description

Constrained MLE optimization for kernels defined by cliques using [constrOptim](#)

Usage

```
kmAdditive(x, y, n.initial.tries = 50, limits = NULL, eps.R = 1e-08, cl,
covtype = "gauss", eps.Var = 1e-06, max.it = 1000, iso = FALSE)
```

Arguments

| | |
|-----------------|--|
| x | a design matrix of input variables, number of columns should be number of variables |
| y | a vector of output variables of the same length as the columns of x |
| n.initial.tries | number of random initial parameters for optimization, defaults to 50 |
| limits | a list with items lower, upper containing boundaries for the covariance parameter vector theta, if NULL suitable bounds are computed from the range of x |
| eps.R | small positive number indicating the nugget effect added to the covariance matrix diagonal, defaults to eps.R = 1e-08 |
| cl | list of cliques, can be obtained by function threshold |
| covtype | an optional character string specifying the covariance structure to be used, to be chosen between "gauss", "matern5_2", "matern3_2", "exp" or "powexp" (see DiceKriging), defaults to "gauss" |
| eps.Var | small positive number providing the limits for the alpha parameters in order to guarantee strict inequalities (0+eps.Var <= alpha <= 1-esp.Var), defaults to eps.Var = 1e-06 |
| max.it | maximum number of iterations for optimization, defaults to max.it=1000 |
| iso | boolean vector indicating for each clique if it is isotropic (TRUE) or anisotropic (FALSE), defaults to iso = FALSE (all cliques anisotropic) |

Value

list of estimated parameter 'alpha' and 'theta' corresponding to the clique structure in 'cl'

# the same since first clique has length 1
parameter <- kmAdditive(x, y, cl = cl, iso=c(TRUE,TRUE))
ypred <- predictAdditive(xpred, x, y, parameter, cl=cl, iso=c(TRUE,TRUE))
sqrt(mean((ypred$mean- yexact)^2))

```

kmPredictWrapper *Wrapper for the Kriging model prediction*

Description

Wrapper for the Kriging model prediction function `predict.km` from package `DiceKriging` to simplify the use of Kriging prediction functions as arguments for functions like `estimateGraph` or `fast99`.

Usage

```
kmPredictWrapper(newdata, km.object)
```

Arguments

| | |
|-----------|---|
| newdata | a vector, matrix or data frame containing the points where to perform predictions |
| km.object | an object of class <code>km</code> |

Value

kriging mean computed at newdata

Author(s)

J. Fruth, O. Roustant

See Also

`estimateGraph`

Examples

```
### graph estimation of a kriging prediction of the ishigami function
set.seed(1)
x <- matrix(runif(150,-pi,pi),100,3)
y <- ishigami.fun(x)
KM <- km(~1, design = data.frame(x), response = y)

g <- estimateGraph(f.mat = kmPredictWrapper, d = 3, n.tot = 10000, q.arg =
  list(min = -pi, max = pi), method = "LiuOwen", km.object = KM)
print(g$ti)
```

L

LHS Dataset

Description

6-dimensional Latin Hypercube Sampling Dataset

Usage

```
data(L)
```

Format

The format is: num [1:100, 1:6] -0.7105 -0.7739 -0.5017 0.6158 0.0245 ...

Examples

```
data(L)
## str(L) ; pairs(L) ...
```

plot.graphlist

Plot Graph via Package [igraph](#)

Description

Plot FANOVA graphs using functions from package [igraph](#).

Usage

```
## S3 method for class 'graphlist'
plot(x, names = NULL, i2 = NULL, layout = NULL, plot.i1=TRUE, max.thickness=15,
circle.diameter=40, ...)
```

Arguments

| | |
|-----------------|---|
| x | an object of class <code>graphlist</code> as obtained from <code>estimateGraph</code> |
| names | optional character string, names of vertices, defaults to 1:d |
| i2 | optional vector of second order interaction indices (thickness of inner edges) |
| plot.i1 | optional boolean, if TRUE main effects are drawn in the graph by vertices thicknesses, should be set to FALSE when only total interaction indices are of interest |
| layout | optional layout for the graph as in <code>igraph</code> , default is <code>layout.fruchterman.reingold</code> |
| max.thickness | optional value for the maximal line thickness, defaults to 20 |
| circle.diameter | optional value for the circle diameter, defaults to 40 |
| ... | additional arguments, passed to <code>plot</code> |

plot(g4, max.thickness= 30, circle.diameter= 50, layout=layout)
```

plotDeltaJumps*Delta Jump Plot*

Description

Threshold discision plot. `plotDeltaJumps` plots the threshold steps (the values of delta at which the graph changes) equidistant against the number of cliques and the values of delta on the real axis. The indices are assumed to be scaled for the threshold cuts.

Usage

```
plotDeltaJumps(graphlist, interval = c(0, 1), mean.clique.size = FALSE)
```

Arguments

- | | |
|-------------------------------|---|
| <code>graphlist</code> | an object of class <code>graphlist</code> as obtained from <code>estimateGraph</code> |
| <code>interval</code> | an optional vector of size 2, range for the values of delta to be shown in the plot, defaults to <code>c(0,1)</code> |
| <code>mean.clique.size</code> | logical, if TRUE (default) an additional line is drawn representing the mean of the number of vertices in the cliques |

Details

The plots shall give help in the choice for the threshold. In the first plot a small number of cliques might be preferable in order to have less parameters to estimate. If several values result in the same number of cliques the ones with higher mean clique size are possibly preferable.

In the second plot a high jump indicates a point of big distance between two successive edge indices and thus a clear change in the graph structure. The intervals with notable jumps are highlighted in green, the higher the jump the darker the colour. Those highlighted intervals together with a small number of cliques are probably good choices for the threshold.

Use `plotGraphChange` to visualize the graph structure for possible threshold values.

Examples

```

tii <- matrix(c(0.0018, 0.0265, 0.0017, 0.0277, 0.0018, 0.001, 0.028, 0.0013,
               0.0212, 0.002, 0.0372, 0.0024, 0.0022, 0.0157, 0.003))
g <- list(d = 6,
          tii = tii,
          i1 = matrix(c(0.0901, 0.1288, 0.0683, 0.0979, 0.0882, 0.1572)),
          V = 0.8,
          tii.scaled = tii/0.8,
          cliques = list(1:6))

### Delta Jump Plot (jump between 0.0038 and 0.0196)
plotDeltaJumps(g)

```

plotGraphChange, plotTk, plotManipulate
Plot Graph as It Changes with Delta

Description

Graphs are plotted depending on a change on delta, the threshold for edges to appear in the graph, to enable a visual decision for delta by graph behavior.

Usage

```

plotGraphChange(graphlist, fix.layout = TRUE, delta.layout = 0.01)
plotTk(graphlist, delta.layout=0.01)
plotManipulate(graphlist, delta.layout=0.01)

```

Arguments

| | |
|--------------|--|
| graphlist | an object of class <code>graphlist</code> as obtained from <code>estimateGraph</code> |
| fix.layout | logical, if TRUE (default) the position of the vertices is fixed for all plots such that the positions are optimal for <code>delta = delta.layout</code> |
| delta.layout | optional value between 0 and 1, see <code>fix.layout</code> , defaults to 0.01 |

Note

`plotGraphChange` shows the changing of the graph step by step by changing plots as in `demo`, `plotTk` is an interactive version using `tcltk`, `plotManipulate` is an interactive version using `manipulate`

predictAdditive

Prediction Function with Modified Kernel

Description

Standard kriging prediction function for the modified correlation functions.

Usage

```
predictAdditive(newdata, x, y, parameter, covtype = "gauss", eps.R = 1e-08,
               cl, iso = FALSE, se.compute=FALSE)
```

Arguments

| | |
|-------------------------|---|
| <code>newdata</code> | matrix containing the points where to perform predictions |
| <code>x</code> | matrix of input data |
| <code>y</code> | vector of output data |
| <code>parameter</code> | (by kmAdditive estimated) kriging parameters, list of size of 'cl' containing for each clique a list of parameters alpha (single value) and theta (numeric vector of values) |
| <code>covtype</code> | an optional character string specifying the covariance structure to be used, to be chosen between "gauss", "matern5_2", "matern3_2", "exp" or "powexp" (see DiceKriging), defaults to "gauss" |
| <code>eps.R</code> | small positive number indicating the nugget effect added to the covariance matrix diagonals, defaults to <code>eps.R = 1e-08</code> |
| <code>cl</code> | list of cliques |
| <code>iso</code> | boolean vector indicating for each clique if it is isotropic (TRUE) or anisotropic (FALSE), defaults to <code>iso = FALSE</code> (all cliques anisotropic) |
| <code>se.compute</code> | optional boolean. If FALSE, only the kriging mean is computed. If TRUE, the kriging variance (actually, the corresponding standard deviation) is computed, too |

Value

| | |
|-------------------|---|
| <code>mean</code> | kriging mean computed at <code>newdata</code> . |
| <code>sd</code> | kriging standard deviation computed at <code>newdata</code> . Only computed if <code>se.compute=TRUE</code> . |

simAdditive*Simulate GP values from block-additive kernel***Description**

Simulate Gaussian process values from a given block-additive kernel

Usage

```
simAdditive(newdata, mu, parameter, covtype, cl, iso = FALSE, eps.R = 1e-08)
```

Arguments

| | |
|------------------------|--|
| <code>newdata</code> | matrix containing the points where to perform simulations |
| <code>mu</code> | trend parameter |
| <code>parameter</code> | list of size of 'cl' containing for each clique a list of parameters alpha (single value) and theta (numeric vector of values) |
| <code>covtype</code> | character string specifying the covariance structure to be used, to be chosen between "gauss", "matern5_2", "matern3_2", "exp" or "powexp" (see DiceKriging) |
| <code>cl</code> | list of cliques |
| <code>iso</code> | boolean vector indicating for each clique if it is isotropic (TRUE) or anisotropic (FALSE), defaults to iso = FALSE (all cliques anisotropic) |
| <code>eps.R</code> | small positive number indicating the nugget effect added to the covariance matrix diagonalk, defaults to eps.R = 1e-08 |

Value

threshold

Threshold indices

Description

All indices below a threshold are set to be zero.

Usage

```
threshold(graphlist, delta, scaled = TRUE, robust = FALSE)
```

Arguments

| | |
|-----------|--|
| graphlist | an object of class graphlist as obtained from estimateGraph |
| delta | numeric threshold, between 0 and 1 if scaled = TRUE |
| scaled | optional boolean, if TRUE, indices are normalized by the overall variance before for threshold cut, defaults to TRUE |
| robust | optional boolean, if TRUE, upper confidence intervals limits are used for the threshold cut instead of indices themselves, confidence intervals must be provided in graphlist, defaults to FALSE |

Value

an object of class graphlist where the indices are thresholded the clique structure is updated respectively, see [estimateGraph](#) for a detailed description

Warning

The threshold cut is by default performed on scaled indices. For a cut on the original unscaled indices set scaled = FALSE.

References

Muehlenstaedt, T.; Roustant, O.; Carraro, L.; Kuhnt, S. (2011) Data-driven Kriging models based on FANOVA-decomposition, *Statistics and Computing*.

Examples

```
# Kriging model prediction
x <- matrix(runif(100*3,-pi,pi),100,3)
KM <- km(~1, design = data.frame(x), response = ishigami.fun(x))
krigingMean <- function(Xnew) predict(object = KM, newdata = Xnew,
  type = "UK", se.compute = FALSE, checkNames = FALSE)$mean

# full graph estimation
g <- estimateGraph(krigingMean, d=3, n.tot=10000, q.arg=list(min=-pi, max=pi))
print(g[c(2,6)])
# threshold graph
g.cut <- threshold(g, delta = 0.1)
print(g.cut[c(2,6)])
```

thresholdIdentification*Function to identify a suitable threshold for an estimateGraph object***Description**

From an `estimateGraph` object and a corresponding data set, candidate threshold values are compared on the prediction performance of the corresponding additive Kriging model. The candidate thresholds are chosen by the biggest jumps in `plotDeltaJumps` together with 0 (the full model) and 1 (the complete additive model). For each of them the Kriging model with corresponding kernel is estimated and the leave-one-out crossvalidations on the original data sets are compared on scatterplots and RMSE-values.

Usage

```
thresholdIdentification(g, x, y, n.cand = 3, covtype = "matern5_2", KM = NULL)
```

Arguments

| | |
|----------------------|--|
| <code>g</code> | object of class <code>graphlist</code> as obtained from <code>estimateGraph</code> |
| <code>x</code> | design matrix of input variables corresponding to <code>g</code> , number of columns should be number of variables |
| <code>y</code> | vector of output variables of the same length as the columns of <code>x</code> |
| <code>n.cand</code> | integer, the <code>n.cand</code> biggest jumps are chosen as candidate threshold values. The default value is 3 |
| <code>covtype</code> | optional character string specifying the covariance structure to be used. The default is "matern5_2" |
| <code>KM</code> | optional object of class <code>km</code> , the full kriging model corresponding to <code>g</code> . With default value <code>NULL</code> , this kriging model is computed by the function itself |

Value

| | |
|---------------------|---|
| a list including | |
| <code>delta</code> | vector of threshold candidates |
| <code>models</code> | list of full model and models with applied thresholds |
| <code>y.cv</code> | list of vectors containing crossvalidation predictions for each model |
| <code>RMSE</code> | vector of residual mean squared errors for each model |

Examples

```
##### simple 3-dimensional example with one interaction

### data (usually existing)
x <- matrix(seq(0,1,,20), 20, 3)
x <- apply(x,2,sample)
y <- 2*(x[,1]-0.5) * (x[,2]-0.5) + 0.1*sin(10*x[,3])

### FANVOA graph (usually estimated from a meta model over the data)
g <- list(d=3,
          tii = matrix(c(0.0140, 0.0008, 0.0002)),
          V = 0.0222,
          tii.scaled = matrix(c(0.6976, 0.0432, 0.0113)))
)
class(g) <- "graphlist"

### plot complete graph
plot(g, plot.i1=FALSE)

### Compare candidate thresholds on prediction performance
set.seed(1)
comparison <- thresholdIdentification(g, x, y, n.cand = 1)
```

Description

Estimation of the unscaled total Sobol index of all main indices by method Liu & Owen (superset importance of main indices).

Usage

```
totalIndex(f.mat, d, q = NULL, q.arg = NULL, n.mc, ...)
```

Arguments

| | |
|-------|--|
| f.mat | vectorized function of which indices shall be estimated |
| d | integer, number of input factors (vertices) |
| q | a vector of character strings of quantile functions corresponding to the factors distributions, it can be a single character string meaning same distribution for all, if not specified "qunif" is taken |
| q.arg | a list of lists of quantile functions parameters of the distributions in q, it can be a single list meaning same parameters for all, if not specified the default values of the respective distributions are taken |
| n.mc | number of Monte Carlo evaluations |
| ... | additional arguments to be passed to the function f.mat |

Value

A vector containing the unscaled total Sobol indices
