Package 'SQMtools'

June 14, 2025

Title Analyze Results Generated by the 'SqueezeMeta' Pipeline

Version 1.7.2

Description 'SqueezeMeta' is a versatile pipeline for the automated analysis of metagenomics/metatranscriptomics data (https:

//github.com/jtamames/SqueezeMeta>). This package provides functions loading 'SqueezeMeta' results into R, filtering them based on different criteria, and visualizing the results using basic plots. The 'SqueezeMeta' project (and any subsets of it generated by the different filtering functions) is parsed into a single object, whose different components (e.g. tables with the taxonomic or functional composition across samples, contig/gene abundance profiles) can be easily analyzed using other R packages such as 'vegan' or 'DESeq2'. The methods in this package are further described in Puente-Sánchez et al., (2020) <doi:10.1186/s12859-020-03703-2>.

Author Fernando Puente-Sánchez [aut, cre],

CheckMProkaryote 3

CheckMProkaryote

CheckM reference markers for Prokaryotes

Description

List of Universal Single Copy Genes for Bacteria and Archaea.

Usage

data(CheckMProkaryote)

Format

List containing vectors of PFAMs, each vector corresponding to a different set of collocated markers

References

Parks, Imelfort, Skennerton, Hugenholtz & Tyson (2015). CheckM: assessing the quality of microbial genomes recovered from isolates, single cells, and metagenomes *Genome Res.* **25**:1043-1055. (PubMed).

See Also

USiCGs, MGOGs and MGKOs for an alternative set of single copy genes, and for examples on how to generate copy numbers.

combineSQM

Combine several SQM objects

Description

Combine an arbitrary number of SQM objects into a single SQM object (if the input objects contain the same samples, i.e. they come from the same SqueezeMeta run) or a single SQMbunch object. For combining results from sqm_reads.pl or sqm_longreads.pl please check combineSQMlite. The parameters below (other than ...) will take only effect if the input objects contain the same samples. Otherwise the input objects will be taken as they are, with no recalculation of taxonomy, function or rescaling,

4 combineSQM

Usage

```
combineSQM(
    ...,
    tax_source = "orfs",
    trusted_functions_only = FALSE,
    ignore_unclassified_functions = FALSE,
    rescale_tpm = TRUE,
    rescale_copy_number = TRUE,
    recalculate_bin_stats = TRUE
)
```

Arguments

an arbitrary number of SQM objects. Alternatively, a single list containing an arbitrary number of SQM objects.

tax_source

character. Features used for calculating aggregated abundances at the different taxonomic ranks. Either "orfs" or "contigs" (default "orfs"). If the objects being combined contain a subset of taxa or bins, this parameter can be set to TRUE.

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE, best hit annotations will be used (default FALSE).

ignore_unclassified_functions

logical. If FALSE, ORFs with no functional classification will be aggregated together into an "Unclassified" category. If TRUE, they will be ignored (default FALSE).

rescale_tpm

logical. If TRUE, TPMs for KEGGs, COGs, and PFAMs will be recalculated (so that the TPMs in the subset actually add up to 1 million). Otherwise, perfunction TPMs will be calculated by aggregating the TPMs of the ORFs annotated with that function, and will thus keep the scaling present in the parent object (default TRUE).

rescale_copy_number

logical. If TRUE, copy numbers with be recalculated using the median single-copy gene coverages in the subset. Otherwise, single-copy gene coverages will be taken from the parent object. By default it is set to TRUE, which means that the returned copy numbers will represent the average copy number per function in the genomes of the selected bins or contigs. If any SQM objects that are being combined contain a functional subset rather than a contig/bins subset, this parameter should be set to FALSE.

recalculate_bin_stats

logical. If TRUE, bin abundance, quality and taxonomy are recalculated based on the contigs present in the subsetted object (default TRUE).

Value

A SQM or SQMbunch object

combineSQMlite 5

See Also

```
subsetFun, subsetTax, combineSQMlite
```

Examples

```
data(Hadza)
# Select Carbohydrate metabolism ORFs in Bacteroidota,
# and Amino acid metabolism ORFs in Proteobacteria
bact = subsetTax(Hadza, "phylum", "Bacteroidota")
bact.carb = subsetFun(bact, "Carbohydrate metabolism")
baci = subsetTax(Hadza, "phylum", "Bacillota")
baci.amins = subsetFun(baci, "Amino acid metabolism")
bact.carb_proteo.amins = combineSQM(bact.carb, baci.amins, rescale_copy_number=FALSE)
```

combineSQMlite

Combine several SQM or SQMlite objects

Description

Combine an arbitrary number of SQM or SQMlite objects into a single SQMlite object. This function accepts objects originating from different projects (i.e. different SqueezeMeta runs).

Usage

```
combineSQMlite(...)
```

Arguments

an arbitrary number of SQM or SQMlite objects. Alternatively, a single list containing an arbitrary number of SQMlite objects.

Value

A SQMlite object

See Also

combineSQM

```
## Not run:
data(Hadza)
# Load data coming from a different run
other = loadSQMlite("/path/to/other/project/tables") # e.g. if the project was run using sqm_reads
# (We could also use loadSQM to load the data as long as the data comes from a SqueezeMeta run)
combined = combineSQMlite(Hadza, other)
# Now we can plot together the samples from Hadza and the second project
plotTaxonomy(combined, 'family')
```

6 exportBins

```
## End(Not run)
```

create_bin

Create a bin from a vector of contigs

Description

Create a bin from a vector of contigs

Usage

```
create_bin(SQM, bin, contigs, delete_overlapping_bins = FALSE)
```

Arguments

SQM A SQM object.

bin character. Name of the bin to be created.

contigs character. Vector with the names of the contigs that will be included in the new

bin.

delete_overlapping_bins

logical. If TRUE, bins that originally contained any of the provided contigs will

be removed from the object. Default FALSE.

Value

SQM object with the new binning information, including recalculated bin statistics if possible.

See Also

find_redundant_contigs, remove_contigs_from_bin

exportBins

Export the bins of a SQM object

Description

Export the bins of a SQM object

Usage

```
exportBins(SQM, output_dir = "")
```

Arguments

SQM A SQM object.

output_dir Existing output directory to which to write the bins.

exportContigs 7

exportContigs Export the contigs of a SQM object	exportContigs	Export the contigs of a SQM object	
--	---------------	------------------------------------	--

Description

Export the contigs of a SQM object

Usage

```
exportContigs(SQM, output_name = "")
```

Arguments

SQM A SQM object.

output_name A connection, or a character string naming the file to print to. If "" (the default),

sequences will be printed to the standard output connection.

exportKrona	Export the taxonomy of a SQM object into a Krona Chart
-------------	--

Description

Generate a krona chart containing the full taxonomy from a SQM object.

Usage

```
exportKrona(SQM, output_name = NA)
```

Arguments

SQM A SQM, SQMbunch or SQMlite object.

output_name character. Name of the output file containing the Krona charts in html format

(default "roject_name>.krona.html").

Details

Original code was kindly provided by Giuseppe D'Auria (dauria_giu@gva.es).

Value

No return value, but a krona chart is produced in the current working directory.

See Also

plotTaxonomy for plotting the most abundant taxa of a SQM object.

8 exportPathway

Examples

```
data(Hadza)
# Check that kronatools is present.
ecode = system('ktImportText', ignore.stdout = TRUE, ignore.stderr = TRUE)
# If so, run.
if(ecode==0) { exportKrona(Hadza, output_name = file.path(tempdir(), "krona.html")) }
```

exportORFs

Export the ORFs of a SQM object

Description

Export the ORFs of a SQM object

Usage

```
exportORFs(SQM, output_name = "")
```

Arguments

SQM A SQM object.

output_name A connection, or a character string naming the file to print to. If "" (the default),

sequences will be printed to the standard output connection.

exportPathway

Export the functions of a SQM object into KEGG pathway maps

Description

This function is a wrapper for the pathview package (Luo *et al.*, 2017. *Nucleic acids research*, 45:W501-W508). It will generate annotated KEGG pathway maps showing which reactions are present in the different samples. It will also generate legends with the color scales for each sample in separate png files.

Usage

```
exportPathway(
   SQM,
   pathway_id,
   count = "copy_number",
   samples = NULL,
   split_samples = FALSE,
   sample_colors = NULL,
   log_scale = FALSE,
```

exportPathway 9

```
fold_change_groups = NULL,
fold_change_colors = NULL,
max_scale_value = NULL,
color_bins = 10,
rescale_percent = FALSE,
output_dir = ".",
output_suffix = "pathview"
)
```

Arguments

SQM A SQM, SQMbunch or SQMlite object.

pathway_id character. The five-number KEGG pathway identifier. A list of all pathway

identifiers can be found in https://www.genome.jp/kegg/pathway.html.

count character. Either "abund" for raw abundances, "percent" for percentages,

"bases" for raw base counts, "tpm" for TPM normalized values or "copy_number" for copy numbers (default "copy_number"). Note that a given count type might not available in this object (e.g. TPM or copy number in SQMlite objects origi-

nating from a SQM reads project).

samples character. An optional vector with the names of the samples to export. If absent,

all samples will be exported (default NULL).

split_samples logical. Generate a different output file for each sample (default FALSE).

sample_colors character. An optional vector with the plotting colors for each sample (default

NULL).

log_scale logical. Use a base 10 logarithmic transformation for the color scale. Will have

no effect if fold_change_groups is provided (default FALSE).

fold_change_groups

list. An optional list containing two vectors of samples. If provided, the function will generate a single plot displaying the $\log 2$ fold-change between the median abundances of both groups of samples ($\log(\text{second group} / \text{first group})$) (default

NULL).

fold_change_colors

character. An optional vector with the plotting colors of both groups in the foldchange plot. Will be ignored if fold_change_group is not provided.

max_scale_value

numeric. Maximum value to include in the color scale. By default it is the maximum value in the selected samples (if plotting abundances in samples) or the maximum absolute log2 fold-change (if plotting fold changes) (default NULL).

color_bins numeric. Number of bins used to generate the gradient in the color scale (default 10).

rescale_percent

logical. Calculate percent counts over the number of reads in the input object, instead of over the total number of reads in the original project (default FALSE).

 $output_dir \qquad \quad character. \ Directory \ in \ which \ to \ write \ the \ output \ files \ (default \ ".").$

output_suffix character. Suffix to be added to the output files (default "pathview").

10 exportTable

Value

A ggplot if split_samples = FALSE and the ggpattern package is installed, otherwise nothing. Additionally, Pathview figures will be written in the directory specified by output_dir.

See Also

plotFunctions for plotting the most functions taxa of a SQM object.

Examples

exportTable

Export results in tabular format

Description

This function is a wrapper for R's write.table function.

Usage

```
exportTable(table, output_name)
```

Arguments

table vector, matrix or data.frame. The table to be written.

output_name Either a character string naming a file or a connection open for writing. """

indicates output to the console.

```
data(Hadza)
Hadza.iron = subsetFun(Hadza, "iron")
# Write the taxonomic distribution at the genus level of all the genes related to iron.
exportTable(Hadza.iron$taxa$genus$percent, file.path(tempdir(), "Hadza.ironGenes.genus.tsv"))
# Now write the distribution of the different iron-related COGs
# (Clusters of Orthologous Groups) across samples.
exportTable(Hadza.iron$functions$COG$tpm, file.path(tempdir(), "Hadza.ironGenes.COG.tsv"))
```

```
# Now write all the information contained in the ORF table.
exportTable(Hadza.iron$orfs$table, file.path(tempdir(), "Hadza.ironGenes.orftable.tsv"))
```

find_redundant_contigs

Find redundant contigs within a bin

Description

Find contigs with overlapping marker genes in a given bin, and suggest contigs to be removed in order to reduce contamination without affecting completeness. Note that this can give a quick idea of the contigs that are sources of contamination within a bin, but is not a replacement for proper bin refininement with other tools such as anvi\'o.

Usage

```
find_redundant_contigs(SQM, bin, minimum_overlap_for_removal = 1)
```

Arguments

SQM A SQM object.
bin character. Name of the bin to be created.

minimum_overlap_for_removal

numeric. Fraction of marker genes in the contigs present in another contig needed to suggest it for removal. If set to 1 (default), contigs will only suggested for removal if their markers fully overlap with those in another contig (and thus completeness will not change after removing them). Smaller values will result in more contigs being suggested for removal, which will further reduce contamination at the expense of some completeness.

Value

A character vector with the contigs deemed to be redundant. A heatmap showing how marker genes overlap over different contigs will also be produced.

See Also

```
create_bin, remove_contigs_from_bin
```

```
data(Hadza)
bin_name = "Hadza2merged.concoct.28.fa.contigs"
# Get redundant contigs that could be removed from our bin
candidates_for_removal = find_redundant_contigs(Hadza, bin_name)
# We can now remove them from the bin
Hadza.new.1 = remove_contigs_from_bin(Hadza, bin_name, candidates_for_removal)
```

12 Hadza

```
# Or we can create a new bin out of them
# which will also remove them from the original bin
Hadza.new.2 = create_bin(Hadza, "new_bin_name", candidates_for_removal)
```

Hadza

Hadza hunter-gatherer gut metagenomes

Description

Subset of two bins (and the associated contigs and genes) generated by running SqueezeMeta on two gut metagenomic samples obtained from two hunter-gatherers of the Hadza ethnic group.

Usage

```
data(Hadza)
```

Format

```
A SQM object; see loadSQM.
```

Source

```
SRR1927149, SRR1929485.
```

References

Rampelli *et al.*, 2015. Metagenome Sequencing of the Hadza Hunter-Gatherer Gut Microbiota. *Curr. biol.* **25**:1682-93 (PubMed).

```
data(Hadza)
plotTaxonomy(Hadza, "genus", rescale=TRUE)
plotFunctions(Hadza, "COG")
```

loadSQM 13

loadSQM

Load a SqueezeMeta project into R

Description

This function takes the path to a project directory generated by SqueezeMeta (whose name is specified in the -p parameter of the SqueezeMeta.pl script) and parses the results into a SQM object. Alternatively, it can load the project data from a zip file produced by sqm2zip.py.

Usage

```
loadSQM(
  project_path,
  tax_mode = "prokfilter",
  trusted_functions_only = FALSE,
  single\_copy\_genes = "MGOGs",
  load_sequences = TRUE,
  engine = "data.table"
)
```

Arguments

project_path

character, a vector of project directories generated by SqueezeMeta, and/or zip files generated by sqm2zip.py.

tax_mode

character, which taxonomic classification should be loaded? SqueezeMeta applies the identity thresholds described in Luo et al., 2014. Use allfilter for applying the minimum identity threshold to all taxa, prokfilter for applying the threshold to Bacteria and Archaea, but not to Eukaryotes, and nofilter for applying no thresholds at all (default prokfilter).

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE, best hit annotations will be used (default FALSE). Will only have an effect if project_path is not a zip file, and project_path/results/tables is not already present.

single_copy_genes

character, source of single copy genes for copy number normalization, either RecA (COG0468, RecA/RadA), MGOGs (COGs for 10 single copy and housekeeping genes, Salazar, G et al. 2019), MGKOs (KOs for 10 single copy and housekeeping genes, Salazar, G et al., 2019) or USiCGs (KOs for 15 single copy genes, Carr et al., 2013. Table S1). For MGOGs, MGKOs and USiCGs, the median coverage of a set of single copy genes will be used for normalization. Default

load_sequences

logical. If TRUE, contig and orf sequences will be loaded in the SQM object. Setting it to FALSE will reduce memory usage. Default TRUE.

engine

character. Engine used to load the ORFs and contigs tables. Either data. frame or data. table (significantly faster if your project is large). Default data. table.

14 loadSQM

Value

SQM object containing the parsed project. If more than one path is provided in project_path this function will return a SQMbunch object instead. The structure of this object is similar to that of a SQMlite object (see loadSQMlite) but with an extra entry named projects that contains one SQM object for input project. SQM and SQMbunch objects will otherwise behave similarly when used with the subset and plot functions from this package.

Prerequisites

Run SqueezeMeta! An example call for running it would be:

```
/path/to/SqueezeMeta/scripts/SqueezeMeta.pl
-m coassembly -f fastq_dir -s samples_file -p project_dir
```

The SQM object structure

The SQM object is a nested list which contains the following information:

lvl1	lvl2	lvl3	type	rows/names	columns	data
\$orfs	\$table		dataframe	orfs	misc. data	misc. data

16 loadSQMlite

If external databases for functional classification were provided to SqueezeMeta via the -extdb argument, the corresponding abundance (reads and bases), coverages, tpm and copy number profiles will be present in SQM\$functions (e.g. results for the CAZy database would be present in SQM\$functions\$CAZy). Additionally, the extended names of the features present in the external database will be present in SQM\$misc(e.g. SQM\$misc\$CAZy_names).

Examples

```
## Not run:
 ## (outside R)
 ## Run SqueezeMeta on the test data.
  /path/to/SqueezeMeta/scripts/SqueezeMeta.pl -p Hadza -f raw -m coassembly -s test.samples
 ## Now go into R.
 library(SQMtools)
 Hadza = loadSQM("Hadza") # Where Hadza is the path to the SqueezeMeta output directory.
 ## End(Not run)
 data(Hadza) # We will illustrate the structure of the SQM object on the test data
 # Which are the ten most abundant KEGG IDs in our data?
 topKEGG = names(sort(rowSums(Hadza$functions$KEGG$tpm), decreasing=TRUE))[1:11]
 topKEGG = topKEGG[topKEGG!="Unclassified"]
 # Which functions do those KEGG IDs represent?
 Hadza$misc$KEGG_names[topKEGG]
 # What is the relative abundance of the Negativicutes class across samples?
 Hadza$taxa$class$percent["Negativicutes",]
 # Which information is stored in the orf, contig and bin tables?
 colnames(Hadza$orfs$table)
 colnames(Hadza$contigs$table)
 colnames(Hadza$bins$table)
 # What is the GC content distribution of my metagenome?
 boxplot(Hadza$contigs$table[,"GC perc"]) # Not weighted by contig length or abundance!
{\tt loadSQMlite}
                         Load tables generated by sqm2tables.py, sqmreads2tables.py or
```

Description

This function takes the path to the output directory generated by sqm2tables.py, sqmreads2tables.py or combine-sqm-tables.py a SQMlite object. The SQMlite object will contain taxonomic and functional profiles, but no detailed information on ORFs, contigs or bins. However, it will also have a much smaller memory footprint. A SQMlite object can be used for plotting and exporting, but it can not be subsetted.

combine-sqm-tables.py into R.

Usage

```
loadSQMlite(tables_path, tax_mode = "allfilter")
```

loadSQMlite 17

Arguments

tables_path character, tables directory generated by sqm2table.py, sqmreads2tables.py

or combine-sqm-tables.py.

tax_mode character, which taxonomic classification should be loaded? SqueezeMeta ap-

plies the identity thresholds described in Luo *et al.*, 2014. Use allfilter for applying the minimum identity threshold to all taxa (default), prokfilter for applying the threshold to Bacteria and Archaea, but not to Eukaryotes, and

nofilter for applying no thresholds at all.

Value

SQMlite object containing the parsed tables.

The SQMlite object structure

The SQMlite object is a nested list which contains the following information:

lvl1	lvl2	lvl3	type	rows/names	columns	data
\$taxa	\$superkingdom	\$abund	numeric matrix	superkingdoms	samples	abundances
		\$percent	numeric matrix	superkingdoms	samples	percentages
	\$phylum	\$abund	numeric matrix	phyla	samples	abundances
		\$percent	numeric matrix	phyla	samples	percentages
	\$class	\$abund	numeric matrix	classes	samples	abundances
		\$percent	numeric matrix	classes	samples	percentages
	\$order	\$abund	numeric matrix	orders	samples	abundances
		\$percent	numeric matrix	orders	samples	percentages
	\$family	\$abund	numeric matrix	families	samples	abundances
		\$percent	numeric matrix	families	samples	percentages
	\$genus	\$abund	numeric matrix	genera	samples	abundances
		\$percent	numeric matrix	genera	samples	percentages
	\$species	\$abund	numeric matrix	species	samples	abundances

MGKOs 19

MGKOs	Single C (KOs)	Сору	Phylogenetic	Marker	Genes from	Sunagawa's g	roup

Description

Lists of Single Copy Phylogenetic Marker Genes. These are useful for transforming coverages or tpms into copy numbers. This is an alternative way of normalizing data in order to be able to compare functional profiles in samples with different sequencing depths.

Usage

data(MGKOs)

Format

Character vector with the KEGG identifiers for 10 Single Copy Phylogenetic Marker Genes.

References

Salazar, G *et al.* (2019). Gene Expression Changes and Community Turnover Differentially Shape the Global Ocean Metatranscriptome *Cell* **179**:1068-1083. (PubMed).

See Also

MGOGs for an equivalent list using OGs instead of KOs; USiCGs for an alternative set of single copy genes, and for examples on how to generate copy numbers.

MGOGs	Single Copy	Phylogenetic	Marker	Genes from	Sunagawa's	group
	(OGs)					

Description

Lists of Single Copy Phylogenetic Marker Genes. These are useful for transforming coverages or tpms into copy numbers. This is an alternative way of normalizing data in order to be able to compare functional profiles in samples with different sequencing depths.

Usage

data(MGOGs)

Format

Character vector with the COG identifiers for 10 Single Copy Phylogenetic Marker Genes.

20 mostAbundant

References

Salazar, G *et al.* (2019). Gene Expression Changes and Community Turnover Differentially Shape the Global Ocean Metatranscriptome *Cell* **179**:1068-1083. (PubMed).

See Also

MGKOs for an equivalent list using KOs instead of OGs; USiCGs for an alternative set of single copy genes, and for examples on how to generate copy numbers.

mostAbundant

Get the N most abundant rows (or columns) from a numeric table

Description

Return a subset of an input matrix or data frame, containing only the N most abundant rows (or columns), sorted. Alternatively, a custom set of rows can be returned.

Usage

```
mostAbundant(
  data,
  N = 10,
  items = NULL,
  others = FALSE,
  rescale = FALSE,
  bycol = FALSE
)
```

Arguments

data	numeric matrix or data frame
N	integer Number of rows to return (default 10).
items	Character vector. Custom row names to return. If provided, it will override N (default NULL).
others	logical. If TRUE, an extra row will be returned containing the aggregated abundances of the elements not selected with N or items (default FALSE).
rescale	logical. Scale result to percentages column-wise (default FALSE).
bycol	logical. Operate on columns instead of rows (default FALSE).

Value

A matrix or data frame (same as input) with the selected rows (or columns).

mostVariable 21

Examples

mostVariable

Get the N most variable rows (or columns) from a numeric table

Description

Return a subset of an input matrix or data frame, containing only the N most variable rows (or columns), sorted. Variability is calculated as the Coefficient of Variation (sd/mean).

Usage

```
mostVariable(data, N = 10, bycol = FALSE)
```

Arguments

data numeric matrix or data frame

N integer Number of rows to return (default 10).

bycol logical. Operate on columns instead of rows (default FALSE).

Value

A matrix or data frame (same as input) with the selected rows or columns.

22 plotBars

```
heatmap(topCarb)
# But for convenience we provide wrappers for plotting ggplot2 heatmaps and barplots
plotHeatmap(topCarb, label_y="TPM")
plotBars(topCarb, label_y="TPM")
```

plotBars

Plot a barplot using ggplot2

Description

Plot a ggplot2 barplot from a matrix or data frame. The data should be in tabular format (e.g. features in rows and samples in columns).

Usage

```
plotBars(
  data,
  label_x = "Samples",
  label_y = "Abundances",
  label_fill = "Features",
  color = NULL,
  base_size = 11,
  max_scale_value = NULL,
  metadata_groups = NULL
)
```

Arguments

data Numeric matrix or data frame. label_x character Label for the x axis (default "Samples"). label_y character Label for the y axis (default "Abundances"). label_fill character Label for color categories (default "Features"). color Vector with custom colors for the different features. If empty, the default ggplot2 palette will be used (default NULL). base_size numeric. Base font size (default 11). max_scale_value numeric. Maximum value to include in the y axis. By default it is handled automatically by ggplot2 (default NULL). metadata_groups list. Split the plot into groups defined by the user: list('G1' = c('sample1', sample2'), 'G2' = c('sample3', 'sample4')) default NULL).

Value

```
a ggplot2 plot object.
```

plotBins 23

See Also

plotTaxonomy for plotting the most abundant taxa of a SQM object; plotHeatmap for plotting a heatmap with arbitrary data; mostAbundant for selecting the most abundant rows in a dataframe or matrix.

Examples

```
data(Hadza)
sk = Hadza$taxa$superkingdom$abund
plotBars(sk, label_y = "Raw reads", label_fill = "Superkingdom")
```

plotBins

Barplot of the most abundant bins in a SQM object

Description

This function selects the most abundant bins across all samples in a SQM object and represents their abundances in a barplot. Alternatively, a custom set of bins can be represented.

Usage

```
plotBins(
    SQM,
    count = "percent",
    N = 15,
    bins = NULL,
    others = TRUE,
    samples = NULL,
    ignore_unmapped = FALSE,
    ignore_nobin = FALSE,
    rescale = FALSE,
    color = NULL,
    base_size = 11,
    max_scale_value = NULL,
    metadata_groups = NULL
)
```

Arguments

SQM	A SQM object.
count	character. Either "abund" for raw abundances, "percent" for percentages, "cov" for coverages, or "cpm" for coverages per million reads (default "percent").
N	integer Plot the N most abundant bins (default 15).
bins	character. Custom bins to plot. If provided, it will override N (default NULL).
others	logical. Collapse the abundances of least abundant bins, and include the result in the plot (default TRUE).

24 plotFunctions

samples character. Character vector with the names of the samples to include in the plot.

Can also be used to plot the samples in a custom order. If not provided, all

samples will be plotted (default NULL).

ignore_unmapped

logical. Don't include unmapped reads in the plot (default FALSE).

ignore_nobin logical. Don't include reads which are not in a bin in the plot (default FALSE).

rescale logical. Re-scale results to percentages (default FALSE).

color Vector with custom colors for the different features. If empty, we will use our

own hand-picked pallete if N<=15, and the default ggplot2 palette otherwise

(default NULL).

base_size numeric. Base font size (default 11).

max_scale_value

numeric. Maximum value to include in the y axis. By default it is handled

automatically by ggplot2 (default NULL).

metadata_groups

list. Split the plot into groups defined by the user: list('G1' = c('sample1',

sample2'), 'G2' = c('sample3', 'sample4')) default NULL).

Value

a ggplot2 plot object.

See Also

plotTaxonomy for plotting the most abundant taxa of a SQM object; plotBars and plotHeatmap for plotting barplots or heatmaps with arbitrary data.

Examples

data(Hadza)
Bins distribution.
plotBins(Hadza)

plotFunctions

Heatmap of the most abundant functions in a SQM object

Description

This function selects the most abundant functions across all samples in a SQM object and represents their abundances in a heatmap. Alternatively, a custom set of functions can be represented.

plotFunctions 25

Usage

```
plotFunctions(
    SQM,
    fun_level = "KEGG",
    count = "copy_number",
    N = 25,
    fun = NULL,
    samples = NULL,
    display_function_names = TRUE,
    ignore_unmapped = TRUE,
    ignore_unclassified = TRUE,
    gradient_col = c("ghostwhite", "dodgerblue4"),
    rescale_percent = FALSE,
    base_size = 11,
    metadata_groups = NULL
)
```

Arguments

SQM A SQM, SQMbunch or SQMlite object.

fun_level character. Either "KEGG", "COG", "PFAM" or any other custom database used for

annotation (default "KEGG").

count character. Either "abund" for raw abundances, "percent" for percentages,

"bases" for raw base counts, "cpm" for coverages per million reads, "tpm" for TPM normalized values or "copy_number" for copy numbers (default "copy_number").

Note that a given count type might not available in this object (e.g. TPM or copy

number in SQMlite objects originating from a SQM reads project).

N integer Plot the N most abundant functions (default 25).

fun character. Custom functions to plot. If provided, it will override N (default

NULL).

samples character. Character vector with the names of the samples to include in the plot.

Can also be used to plot the samples in a custom order. If not provided, all

samples will be plotted (default NULL).

display_function_names

logical. Plot function names alongside function IDs, if available (default TRUE).

ignore_unmapped

logical. Don't include unmapped reads in the plot (default TRUE).

ignore_unclassified

logical. Don't include unclassified ORFs in the plot (default TRUE).

gradient_col A vector of two colors representing the low and high ends of the color gradient

(default c("ghostwhite", "dodgerblue4")).

rescale_percent

logical. Calculate percent counts over the number of reads in the input object, instead of over the total number of reads in the original project (default FALSE).

base_size numeric. Base font size (default 11).

26 plotHeatmap

```
metadata_groups list. Split the plot into groups defined by the user: list('G1' = c('sample1', sample2'), 'G2' = c('sample3', 'sample4')) default NULL).
```

Value

a ggplot2 plot object.

See Also

plotTaxonomy for plotting the most abundant taxa of a SQM object; plotBars and plotHeatmap for plotting barplots or heatmaps with arbitrary data.

Examples

```
data(Hadza)
plotFunctions(Hadza)
```

plotHeatmap

Plot a heatmap using ggplot2

Description

Plot a ggplot2 heatmap from a matrix or data frame. The data should be in tabular format (e.g. features in rows and samples in columns).

Usage

```
plotHeatmap(
  data,
  label_x = "Samples",
  label_y = "Features",
  label_fill = "Abundance",
  gradient_col = c("ghostwhite", "dodgerblue4"),
  base_size = 11,
  metadata_groups = NULL
)
```

Arguments

```
numeric matrix or data frame.

label_x character Label for the x axis (default "Samples").

label_y character Label for the y axis (default "Features").

label_fill character Label for color scale (default "Abundance").

gradient_col A vector of two colors representing the low and high ends of the color gradient (default c("ghostwhite", "dodgerblue4")).

base_size numeric. Base font size (default 11).
```

plotTaxonomy 27

```
metadata_groups list. Split the plot into groups defined by the user: list('G1' = c('sample1', sample2'), 'G2' = c('sample3', 'sample4')) default NULL).
```

Value

A ggplot2 plot object.

See Also

plotFunctions for plotting the top functional categories of a SQM object; plotBars for plotting a barplot with arbitrary data; mostAbundant for selecting the most abundant rows in a dataframe or matrix.

Examples

```
data(Hadza)
topPFAM = mostAbundant(Hadza$functions$PFAM$tpm)
topPFAM = topPFAM[rownames(topPFAM) != "Unclassified",] # Take out the Unclassified ORFs.
plotHeatmap(topPFAM, label_x = "Samples", label_y = "PFAMs", label_fill = "TPM")
```

plotTaxonomy

Barplot of the most abundant taxa in a SQM object

Description

This function selects the most abundant taxa across all samples in a SQM object and represents their abundances in a barplot. Alternatively, a custom set of taxa can be represented.

Usage

```
plotTaxonomy(
  SQM,
  rank = "phylum",
  count = "percent",
 N = 15,
  tax = NULL,
  others = TRUE,
  samples = NULL,
  nocds = "treat_separately",
  ignore_unmapped = FALSE,
  ignore_unclassified = FALSE,
  no_partial_classifications = FALSE,
  rescale = FALSE,
  color = NULL,
 base_size = 11,
 max_scale_value = NULL,
 metadata_groups = NULL
)
```

28 plotTaxonomy

Arguments

SQM A SQM, SQMbunch or a SQMlite object.
rank Taxonomic rank to plot (default phylum).

count character. Either "percent" for percentages, or "abund" for raw abundances

(default "percent").

N integer Plot the N most abundant taxa (default 15).

tax character. Custom taxa to plot. If provided, it will override N (default NULL).

others logical. Collapse the abundances of least abundant taxa, and include the result

in the plot (default TRUE).

samples character. Character vector with the names of the samples to include in the plot.

Can also be used to plot the samples in a custom order. If not provided, all

samples will be plotted (default NULL).

nocds character. Either "treat_separately" to treat reads annotated as No CDS sep-

arately, "treat_as_unclassified" to treat them as Unclassified or "ignore"

to ignore them in the plot (default "treat_separately").

ignore_unmapped

logical. Don't include unmapped reads in the plot (default FALSE).

ignore_unclassified

logical. Don't include unclassified reads in the plot (default FALSE).

no_partial_classifications

logical. Treat reads not fully classified at the requested level (e.g. "Unclassified Bacteroidota" at the class level or below) as fully unclassified. This takes effect before <code>ignore_unclassified</code>, so if both are TRUE the plot will only contain

fully classified contigs (default FALSE).

rescale logical. Re-scale results to percentages (default FALSE).

color Vector with custom colors for the different features. If empty, we will use our

own hand-picked pallete if N<=15, and the default ggplot2 palette otherwise

(default NULL).

base_size numeric. Base font size (default 11).

max_scale_value

numeric. Maximum value to include in the y axis. By default it is handled

automatically by ggplot2 (default NULL).

metadata_groups

list. Split the plot into groups defined by the user: list('G1' = c('sample1',

sample2'), 'G2' = c('sample3', 'sample4')) default NULL).

Value

a ggplot2 plot object.

See Also

plotFunctions for plotting the most abundant functions of a SQM object; plotBars and plotHeatmap for plotting barplots or heatmaps with arbitrary data.

RecA 29

Examples

```
data(Hadza)
Hadza.amin = subsetFun(Hadza, "Amino acid metabolism")
# Taxonomic distribution of amino acid metabolism ORFs at the family level.
plotTaxonomy(Hadza.amin, "family")
```

RecA

RecA/RadA recombinase

Description

The recombination protein RecA/RadA is essential for the repair and maintenance of DNA, and has homologs in every bacteria and archaea. By dividing the coverage of functions by the coverage of RecA, abundances can be transformed into copy numbers, which can be used to compare functional profiles in samples with different sequencing depths. RecA-derived copy numbers are available in the SQM object (SQM\$functions\$<annotation_type>\$copy_number).

Usage

data(RecA)

Format

Character vector with the COG identifier for RecA/RadA.

Source

EggNOG Database.

```
data(Hadza)
data(RecA)
### Let's calculate the average copy number of each function in our samples.
# We do it for COG annotations here, but we could also do it for KEGG or PFAMs.
COG.coverage = Hadza$functions$COG$cov
COG.copynumber = t(t(COG.coverage) / COG.coverage[RecA,]) # Sample-wise division by RecA coverage.
```

30 rowMaxs

remove_contigs_from_bin

Remove contigs from a given bin

Description

Remove contigs from a given bin

Usage

```
remove_contigs_from_bin(SQM, bin, contigs)
```

Arguments

SQM A SQM object.

bin character. Name of the bin from which the contigs will be removed.

contigs character. Vector with the names of the contigs that will be removed from the

new bin.

Value

SQM object with the new binning information, including recalculated bin statistics if possible.

See Also

find_redundant_contigs, create_bin

rowMaxs

Return a vector with the row-wise maxima of a matrix or dataframe.

Description

Return a vector with the row-wise maxima of a matrix or dataframe.

Usage

```
rowMaxs(table)
```

Arguments

table matrix or dataframe.

Value

a vector with the row-wise maxima.

rowMins 31

rowMins

Return a vector with the row-wise minima of a matrix or dataframe.

Description

Return a vector with the row-wise minima of a matrix or dataframe.

Usage

```
rowMins(table)
```

Arguments

table

matrix or dataframe.

Value

a vector with the row-wise minima.

seqvec2fasta

Print a named vector of sequences as a fasta-formatted string

Description

Print a named vector of sequences as a fasta-formatted string

Usage

```
seqvec2fasta(seqvec, output_name = "")
```

Arguments

seqvec

vector. The vector to be written as a fasta string.

output_name

A connection, or a character string naming the file to print to. If "" (the default),

sequences will be printed to the standard output connection.

```
data(Hadza)
seqvec2fasta(Hadza$orfs$seqs[1:10])
```

32 SQM_to_microeco

SQM_to_microeco	Convert a SQM object into a microtable object from the microeco package
-----------------	---

Description

This function will convert the selected features from a SQM object into an object of the microtable class from the microeco package. When possible, it will also include the taxonomy of the included features (for functional classifications, the taxonomy table will instead include the description of each feature ID). Optionally, it accepts a meta table that will be passed as provided to microtable\$new.

Usage

```
SQM_to_microeco(
    SQM,
    features = "genus",
    count = "abund",
    md = NULL,
    nocds = "treat_separately",
    no_partial_classifications = FALSE,
    ignore_unclassified = FALSE,
    ignore_unmapped = FALSE,
    bin_tax_source = "SQM",
    include_seqs = FALSE
)
```

Arguments SQM

count

md

nocds

features	character. Either "orfs", "contigs", "bins", any taxonomic rank included
	in SQM\$taxa or any functional classication included in SQM\$functions (default
	"tax"). Note that a given feature type might not be available in this objects (e.g.
	"contigs" in SQMlite objects originating from a SQM reads project).

A SQM, SQMbunch or SQMlite object.

character. Either "abund" for raw abundances, "percent" for percentages,
"bases" for raw base counts, "cov" for coverages, "cpm" for coverages per
million reads, "tpm" for TPM normalized values or "copy_number" for copy
numbers (default "abund"). Note that a given count type might not available
in this object (e.g. TPM or copy number in SQMlite objects originating from a
SQM reads project).

data.frame.	A optional data.frame	containing	metadata	for the	samples	in	the
SQM object	.••						

character. Either "treat_separately" to treat features annotated as No CDS
separately, "treat_as_unclassified" to treat them as Unclassified or "ignore"
to ignore them in the output (default "treat separately").

SQM_to_phyloseq 33

```
no_partial_classifications
```

logical. When features is a taxonomic rank, treat features not fully classified at the requested level (e.g. "Unclassified bacteroidota" at the class level or below) as fully unclassified. This takes effect before ignore_unclassified, so if both are TRUE the plot will only contain features that were fully classified at the requested level (default FALSE).

ignore_unclassified

logical. When features is a taxonomic rank or functional category, don't include unclassified reads in the output (default FALSE).

ignore_unmapped

logical. Don't include unmapped reads in the output (default FALSE).

bin_tax_source character. Source of taxonomy when features = "bins", either "SQM" of "gtdb"

(default "gtdb").

include_seqs logical. Whether to include sequences or not if creating a microtable from con-

tigs (default FALSE).

Value

A microtable.

See Also

SQM_to_phyloseq for exporting a SQM/SQMlite/SQM object as a phyloseq object.

SQM_to_phyloseq

Convert a SQM object into a phyloseq object from the phyloseq package

Description

This function will convert the selected features from a SQM object into a phyloseq object from the phyloseq package. When possible, it will also include the taxonomy of the included features (for functional classifications, the taxonomy table will instead include the description of each feature ID). Optionally, it accepts a meta table that will be passed as provided to the phyloseq object constructor.

Usage

```
SQM_to_phyloseq(
   SQM,
   features = "genus",
   count = "abund",
   md = NULL,
   nocds = "treat_separately",
   no_partial_classifications = FALSE,
   ignore_unclassified = FALSE,
```

34 SQM_to_phyloseq

```
ignore_unmapped = FALSE,
bin_tax_source = "SQM",
include_seqs = FALSE
)
```

Arguments

SQM A SQM, SQMbunch or SQMlite object.

features character. Either "orfs", "contigs", "bins", any taxonomic rank included

in SQM\$taxa or any functional classication included in SQM\$functions (default "tax"). Note that a given feature type might not be available in this objects (e.g.

"contigs" in SQMlite objects originating from a SQM reads project).

count character. Either "abund" for raw abundances, "percent" for percentages,

"bases" for raw base counts, "cov" for coverages, "cpm" for coverages per million reads, "tpm" for TPM normalized values or "copy_number" for copy numbers (default "abund"). Note that a given count type might not available in this object (e.g. TPM or copy number in SQMlite objects originating from a

SQM reads project).

md data.frame. A optional data.frame containing metadata for the samples in the

SQM object.

nocds character. Either "treat_separately" to treat features annotated as No CDS

separately, "treat_as_unclassified" to treat them as Unclassified or "ignore"

to ignore them in the output (default "treat_separately").

no_partial_classifications

logical. When features is a taxonomic rank, treat features not fully classified at the requested level (e.g. "Unclassified bacteroidota" at the class level or below) as fully unclassified. This takes effect before ignore_unclassified, so if both are TRUE the plot will only contain features that were fully classified at the

requested level (default FALSE).

ignore_unclassified

logical. When features is a taxonomic rank or functional category, don't in-

clude unclassified reads in the output (default FALSE).

ignore_unmapped

logical. Don't include unmapped reads in the output (default FALSE).

bin_tax_source character. Source of taxonomy when features = "bins", either "SQM" of "gtdb"

(default "gtdb").

include_seqs logical. Whether to include sequences or not if creating a microtable from ORFs

or contigs (default FALSE).

Value

A phyloseq object.

See Also

SQM_to_microeco for exporting a SQM/SQMlite/SQM object as a microtable object.

subsetBins 35

subsetBins

Create a SQM object containing only the requested bins, and the contigs and ORFs contained in them.

Description

Create a SQM object containing only the requested bins, and the contigs and ORFs contained in them.

Usage

```
subsetBins(
   SQM,
   bins,
   trusted_functions_only = FALSE,
   ignore_unclassified_functions = FALSE,
   rescale_tpm = TRUE,
   rescale_copy_number = TRUE,
   allow_empty = FALSE
)
```

Arguments

SQM

SQM object to be subsetted.

bins

character. Vector of bins to be selected.

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE, best hit annotations will be used (default FALSE).

ignore_unclassified_functions

logical. If FALSE, ORFs with no functional classification will be aggregated together into an "Unclassified" category. If TRUE, they will be ignored (default FALSE).

rescale_tpm

logical. If TRUE, TPMs for KEGGs, COGs, and PFAMs will be recalculated (so that the TPMs in the subset actually add up to 1 million). Otherwise, perfunction TPMs will be calculated by aggregating the TPMs of the ORFs annotated with that function, and will thus keep the scaling present in the parent object. By default it is set to TRUE, which means that the returned TPMs will be scaled by million of reads of the selected bins.

rescale_copy_number

logical. If TRUE, copy numbers with be recalculated using the median single-copy gene coverages in the subset. Otherwise, single-copy gene coverages will be taken from the parent object. By default it is set to TRUE, which means that the returned copy numbers for each function will represent the average copy number of that function *per genome of the selected taxon*.

allow_empty

(internal use only).

36 subsetContigs

Value

SQM object containing only the requested bins.

See Also

```
subsetContigs, subsetORFs
```

Examples

subsetContigs

Select contigs

Description

Create a SQM object containing only the requested contigs, the ORFs contained in them and the bins that contain them.

Usage

```
subsetContigs(
   SQM,
   contigs,
   trusted_functions_only = FALSE,
   ignore_unclassified_functions = FALSE,
   rescale_tpm = FALSE,
   rescale_copy_number = FALSE,
   recalculate_bin_stats = TRUE,
   allow_empty = FALSE
)
```

Arguments

SQM object to be subsetted.
contigs character. Vector of contigs to be selected.

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE, best hit annotations will be used (default FALSE).

subsetFun 37

ignore_unclassified_functions

logical. If FALSE, ORFs with no functional classification will be aggregated together into an "Unclassified" category. If TRUE, they will be ignored (default FALSE).

rescale_tpm

logical. If TRUE, TPMs for KEGGs, COGs, and PFAMs will be recalculated (so that the TPMs in the subset actually add up to 1 million). Otherwise, perfunction TPMs will be calculated by aggregating the TPMs of the ORFs annotated with that function, and will thus keep the scaling present in the parent object (default FALSE).

rescale_copy_number

logical. If TRUE, copy numbers with be recalculated using the median single-copy gene coverages in the subset. Otherwise, single-copy gene coverages will be taken from the parent object. By default it is set to FALSE, which means that the returned copy numbers for each function will represent the average copy number of that function per genome in the parent object.

recalculate_bin_stats

logical. If TRUE, bin abundance, quality and taxonomy are recalculated based on the contigs present in the subsetted object (default TRUE).

allow_empty (internal use only).

Value

SQM object containing only the selected contigs.

See Also

subsetORFs

Examples

```
data(Hadza)
# Which contigs have a GC content below 40?
lowGCcontigNames = rownames(Hadza$contigs$table[Hadza$contigs$table[,"GC perc"]<40,])
lowGCcontigs = subsetContigs(Hadza, lowGCcontigNames)
hist(lowGCcontigs$contigs$table[,"GC perc"])</pre>
```

subsetFun

Filter results by function

Description

Create a SQM or SQMbunch object containing only the ORFs with a given function, and the contigs and bins that contain them.

38 subsetFun

Usage

```
subsetFun(
   SQM,
   fun,
   columns = NULL,
   ignore_case = TRUE,
   fixed = FALSE,
   trusted_functions_only = FALSE,
   ignore_unclassified_functions = FALSE,
   rescale_tpm = FALSE,
   rescale_copy_number = FALSE,
   recalculate_bin_stats = FALSE,
   allow_empty = FALSE
)
```

Arguments

SQM or SQMbunch object to be subsetted.

fun character. Pattern to search for in the different functional classifications.

columns character. Restrict the search to the provided column names from SQM\$orfs\$table.

If not provided the search will be performed in all the columns containing func-

tional information (default NULL).

ignore_case logical Make pattern matching case-insensitive (default TRUE).

fixed logical. If TRUE, pattern is a string to be matched as is. If FALSE the pattern is

treated as a regular expression (default FALSE).

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE,

best hit annotations will be used (default FALSE).

ignore_unclassified_functions

logical. If FALSE, ORFs with no functional classification will be aggregated together into an "Unclassified" category. If TRUE, they will be ignored (default FALSE).

.

rescale_tpm

logical. If TRUE, TPMs for KEGGs, COGs, and PFAMs will be recalculated (so that the TPMs in the subset actually add up to 1 million). Otherwise, perfunction TPMs will be calculated by aggregating the TPMs of the ORFs annotated with that function, and will thus keep the scaling present in the parent object (default FALSE).

rescale_copy_number

logical. If TRUE, copy numbers with be recalculated using the median single-copy gene coverages in the subset. Otherwise, single-copy gene coverages will be taken from the parent object. By default it is set to FALSE, which means that the returned copy numbers for each function will represent the average copy number of that function per genome in the parent object.

recalculate_bin_stats

logical. If TRUE, bin abundance, quality and taxonomy are recalculated based on the contigs present in the subsetted object (default FALSE).

subsetORFs 39

```
allow_empty (internal use only).
```

Value

SQM or SQMbunch object containing only the requested function.

See Also

subsetTax, subsetORFs, subsetSamples, combineSQM. The most abundant items of a particular table contained in a SQM object can be selected with mostAbundant.

Examples

```
data(Hadza)
Hadza.iron = subsetFun(Hadza, "iron")
Hadza.carb = subsetFun(Hadza, "Carbohydrate metabolism")
# Search for multiple patterns using regular expressions
Hadza.twoKOs = subsetFun(Hadza, "K00812|K00813", fixed=FALSE)
```

subsetORFs

Select ORFs

Description

Create a SQM object containing only the requested ORFs, and the contigs and bins that contain them. Internally, all the other subset functions in this package end up calling subsetORFs to do the work for them.

Usage

```
subsetORFs(
   SQM,
   orfs,
   tax_source = "orfs",
   trusted_functions_only = FALSE,
   ignore_unclassified_functions = FALSE,
   rescale_tpm = FALSE,
   rescale_copy_number = FALSE,
   recalculate_bin_stats = TRUE,
   contigs_override = NULL,
   allow_empty = FALSE
)
```

40 subsetORFs

Arguments

SQM object to be subsetted.

orfs character. Vector of ORFs to be selected.

tax_source character. Features used for calculating aggregated abundances at the different

taxonomic ranks. Either "orfs" or "contigs" (default "orfs").

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE, best hit annotations will be used (default FALSE).

ignore_unclassified_functions

logical. If FALSE, ORFs with no functional classification will be aggregated together into an "Unclassified" category. If TRUE, they will be ignored (default FALSE).

1712

rescale_tpm

logical. If TRUE, TPMs for KEGGs, COGs, and PFAMs will be recalculated (so that the TPMs in the subset actually add up to 1 million). Otherwise, perfunction TPMs will be calculated by aggregating the TPMs of the ORFs annotated with that function, and will thus keep the scaling present in the parent object (default FALSE).

rescale_copy_number

logical. If TRUE, copy numbers with be recalculated using the median single-copy gene coverages in the subset. Otherwise, single-copy gene coverages will be taken from the parent object. By default it is set to FALSE, which means that the returned copy numbers for each function will represent the average copy number of that function per genome in the parent object.

recalculate_bin_stats

logical. If TRUE, bin abundance, quality and taxonomy are recalculated based on the contigs present in the subsetted object (default TRUE).

contigs_override

character. Optional vector of contigs to be included in the subsetted object.

allow_empty (internal use only).

Value

SQM object containing the requested ORFs.

A note on contig/bins subsetting

While this function selects the contigs and bins that contain the desired orfs, it DOES NOT recalculate contig abundance and statistics based on the selected ORFs only. This means that the abundances presented in tables such as SQM\$contig\$abund will still refer to the complete contigs, regardless of whether only a fraction of their ORFs are actually present in the returned SQM object. This is also true for the statistics presented in SQM\$contigs\$table. Bin statistics may be recalculated if rescale_copy_number is set to TRUE, but recalculation will be based on contigs, not ORFs.

subsetRand 41

Examples

```
data(Hadza)
# Select the 100 most abundant ORFs in our dataset.
mostAbundantORFnames = names(sort(rowSums(Hadza$orfs$tpm), decreasing=TRUE))[1:100]
mostAbundantORFs = subsetORFs(Hadza, mostAbundantORFnames)
```

subsetRand

Select random ORFs

Description

Create a random subset of a SQM object.

Usage

```
subsetRand(SQM, N)
```

Arguments

SQM object to be subsetted.

N numeric. number of random ORFs to select.

Value

SQM object containing a random subset of ORFs.

See Also

subsetORFs

subsetSamples

Filter results by sample

Description

Create a SQM object containing only samples specified by the user, and the ORFs, contigs, bins, taxa and functions present in those samples.

Usage

```
subsetSamples(SQM, samples, remove_missing = TRUE)
```

42 subsetTax

Arguments

SQM object to be subsetted.

samples character. Samples to be included in the subset.

remove_missing bool. If TRUE, ORFs, contigs, bins, taxa and functions absent from the selected

samples will be removed from the subsetted object (default TRUE).

Value

SQM object containing only the requested samples.

See Also

subsetTax, subsetFun, subsetORFs, combineSQM. The most abundant items of a particular table contained in a SQM object can be selected with mostAbundant.

subsetTax

Filter results by taxonomy

Description

Create a SQM or SQMbunch object containing only the contigs with a given consensus taxonomy, the ORFs contained in them and the bins that contain them.

Usage

```
subsetTax(
    SQM,
    rank,
    tax,
    trusted_functions_only = FALSE,
    ignore_unclassified_functions = FALSE,
    rescale_tpm = TRUE,
    rescale_copy_number = TRUE,
    recalculate_bin_stats = FALSE,
    allow_empty = FALSE
)
```

Arguments

SQM object to be subsetted.

rank character. The taxonomic rank from which to select the desired taxa (superkingdom,

phylum, class, order, family, genus, species)

tax character. A taxon or vector of taxa to be selected.

trusted_functions_only

logical. If TRUE, only highly trusted functional annotations (best hit + best average) will be considered when generating aggregated function tables. If FALSE,

best hit annotations will be used (default FALSE).

summary.SQM 43

ignore_unclassified_functions

logical. If FALSE, ORFs with no functional classification will be aggregated together into an "Unclassified" category. If TRUE, they will be ignored (default FALSE).

rescale_tpm

logical. If TRUE, TPMs for KEGGs, COGs, and PFAMs will be recalculated (so that the TPMs in the subset actually add up to 1 million). Otherwise, perfunction TPMs will be calculated by aggregating the TPMs of the ORFs annotated with that function, and will thus keep the scaling present in the parent object. By default it is set to TRUE, which means that the returned TPMs will be scaled *by million of reads of the selected taxon*.

rescale_copy_number

logical. If TRUE, copy numbers with be recalculated using the median single-copy gene coverages in the subset. Otherwise, single-copy gene coverages will be taken from the parent object. By default it is set to TRUE, which means that the returned copy numbers for each function will represent the average copy number of that function *per genome of the selected taxon*.

recalculate_bin_stats

logical. If TRUE, bin abundance, quality and taxonomy are recalculated based on the contigs present in the subsetted object (default TRUE).

allow_empty (internal use only).

Value

SQM or SQMbunch object containing only the requested taxon.

See Also

subsetFun, subsetContigs, subsetSamples, combineSQM. The most abundant items of a particular table contained in a SQM object can be selected with mostAbundant.

Examples

```
data(Hadza)
Hadza.Prevotella = subsetTax(Hadza, "genus", "Prevotella")
Hadza.Bacteroidota = subsetTax(Hadza, "phylum", "Bacteroidota")
```

summary.SQM

summary method for class SQM

Description

Computes different statistics of the data contained in the SQM object.

Usage

```
## S3 method for class 'SQM'
summary(object, ...)
```

44 summary.SQMlite

Arguments

```
object SQM object to be summarized.
... Additional parameters (ignored).
```

Value

A list of summary statistics.

summary.SQMbunch

summary method for class SQMbunch

Description

Computes different statistics of the data contained in the SQMbunch object.

Usage

```
## S3 method for class 'SQMbunch'
summary(object, ...)
```

Arguments

object SQMbunch object to be summarized.
... Additional parameters (ignored).

Value

A list of summary statistics.

 ${\tt summary.SQMlite}$

summary method for class SQMlite

Description

Computes different statistics of the data contained in the SQMlite object.

Usage

```
## S3 method for class 'SQMlite'
summary(object, ...)
```

Arguments

object SQMlite object to be summarized.
... Additional parameters (ignored).

USiCGs 45

Value

A list of summary statistics.

USiCGs

Universal Single-Copy Genes

Description

Lists of Universal Single Copy Genes for Bacteria and Archaea. These are useful for transforming coverages or tpms into copy numbers. This is an alternative way of normalizing data in order to be able to compare functional profiles in samples with different sequencing depths.

Usage

```
data(USiCGs)
```

Format

Character vector with the KEGG identifiers for 15 Universal Single Copy Genes.

Source

```
Carr et al., 2013. Table S1.
```

References

Carr, Shen-Orr & Borenstein (2013). Reconstructing the Genomic Content of Microbiome Taxa through Shotgun Metagenomic Deconvolution *PLoS Comput. Biol.* **9**:e1003292. (PubMed).

See Also

MGOGs and MGKOs for an alternative set of single copy genes, and for examples on how to generate copy numbers.

```
data(Hadza)
data(USiCGs)
### Let's look at the Universal Single Copy Gene distribution in our samples.
KEGG.tpm = Hadza$functions$KEGG$tpm
all(USiCGs %in% rownames(KEGG.tpm)) # Are all the USiCGs present in our dataset?
# Plot a boxplot of USiCGs tpms and calculate median USiCGs tpm.
# This looks weird in the test dataset because it contains only a small subset of the metagenomes.
# In a set of complete metagenomes USiCGs should have fairly similar TPM averages
# and low dispersion across samples.
boxplot(t(KEGG.tpm[USiCGs,]), names=USiCGs, ylab="TPM", col="slateblue2")
### Now let's calculate the average copy numbers of each function.
# We do it for KEGG annotations here, but we could also do it for COGs or PFAMs.
```

46 USiCGs

USiCGs.cov = apply(Hadza\$functions\$KEGG\$cov[USiCGs,], 2, median)
Sample-wise division by the median USiCG coverage.
KEGG.copynumber = t(t(Hadza\$functions\$KEGG\$cov) / USiCGs.cov)
